The telecommunication industry has undergone dramatic changes in recent years, including a shift from synchronous optical networks (SONETs) to synchronous digital hierarchy (SDH) networks. One reason for the industry shift is that SDH networks are more flexible than SONET networks. SONET networks generally have lower latency, higher reliability and better jitter than SDH networks. However, when routing data in the SONET network, a SONET network scheduler cannot directly select an

appropriate path for each of a plurality of nodes in the SONET network because the SONET network is not a self-routing network. To avoid a SONET network scheduler from selecting an inappropriate path when routing data through a SONET network, an existing ring protection scheme has been proposed. Generally, the ring protection scheme adds an extra node to a SONET ring to protect the SONET ring when the SONET ring experiences a failure. When a failure occurs, the added node becomes a source of protection for the SONET ring. Since the added node is a ring protection node (
