The increasing number of wireless communication devices, also referred to as radio frequency (RF) devices, in use today has led to a corresponding increase in the number of available RF bands. This trend is expected to continue as the use of RF devices increase and as RF bands continue to be consolidated. The increased number of available RF bands, however, poses challenges for RF devices and RF device operators alike in selecting suitable RF bands to use. With respect to the RF devices themselves, it is often challenging for RF devices to identify, select and use RF bands due to the high number of available RF bands. Even if the RF devices are able to identify and select the desired RF bands, RF device operators may be required to wait a lengthy period of time to have RF device capabilities become available and/or to receive additional training on the RF bands. Such difficulties, delays and costs associated with identifying, selecting and using RF bands are further complicated by RF device operators' desire to continuously upgrade to RF devices that are able to identify and select more RF bands. From a RF device operator's perspective, one of the challenges with using the various RF bands is the large number of RF devices currently deployed or to be deployed. As a result, RF device operators must make selections that will allow for the most productive and efficient use of the RF devices in their network. Unfortunately, many RF device operators are not trained to make such selections and therefore, must rely on RF device manufacturers to make such selections for
